About The Manual

Literature Change History

CG-SVP01B-EN (January 2005)

Original issue of this manual; provides specific programming, diagnostic, and troubleshooting information CGAF units with "K" and later design sequence.

Overview of Manual

Note: One copy of this document ships inside the control panel of each unit and is customer property. It must be retained by the unit's maintenance personnel.

These units are equipped with electronic control modules which provides operating functions that are significantly different than conventional units.

The manual is divided into 6 sections. Each section provides the operator with specific information about the system operating parameters and their related screens. By carefully following the screen layout within this manual while scrolling through the Human Interface, the operator can monitor operating status, set specific operating parameters, and diagnose system problems.

Before attempting to operate or service this equipment, refer to the "Start-Up" and "Test Mode" procedures in the applicable Installation, Operation and Maintenance manual, listed on the unit nameplate.

Note: The procedures discussed in this manual should only be performed by qualified, experienced HVAC technicians.

Refer to the Table of Contents and Index for specific topics contained in this manual and supporting manuals.

Table of Contents

General Information

Model Number Description

All Trane products are identified by a multiple-character model number that precisely identifies a particular type of unit. An explanation of the alphanumeric identification code is provided below. Its use will enable the owner/operator, installing contractors, and service engineers to define the op-

eration, specific components, and other options for any specific unit.

When ordering replacement parts or requesting service, be sure to refer to the specific model number, serial number, and DL number (if applicable) stamped on the unit nameplate.

Sample Model Number:	CGAF - C30	4 A A B 0 D etc.
Digit Number:	1,2,3,4	5,6,7 8 9 10 11 12 13 +
Digit 1,2 - Unit Function CG = Cold Generator	Digit 9 - Heating Capacity A = Standard	Digit 13, etc. Miscellaneous A = Communications Interface (TCI) B = No Unit Heat Tape (50 Hz Units Only) C = Compressor Current Sensing (CSM) D = Non-Fused Unit-Mounted Disconnect E = *Unit Isolators - Neoprene P/S F = *Unit Isolators - Spring P/S G = Superheat / Subcooling H = Hot Gas Bypass J = Generic BAS Module 0-5 VDC Input, Binary O.P K = Stock Unit L = LonTalk® Communication Interface Module M = *Remote Human Interface N = Generic BAS Module 0-10 VDC Analog Output P = Remote Setpoint Potentiometer P/S Q = *Zone Sensor (Chilled Solution Reset) P/S S = Special V = Copper Fin Condenser Coil W = **Electronic Low Ambient Dampers P/S Y = *Inter-Processor Comm Bridge (IPCB) 9 = Packed Stock Unit * = Field Installed Options ** = Factory or Field Installed Option *** Available on Pack Stock Units
Digit 3 - Unit Type A = Air-Cooled Condenser	Digit 10 - Design Sequence H = Brazed Plate Chiller	
Digit 4 - Development Sequence F = Sixth	Digit 11 - Leaving Water Setpoint A = 40 - 50 F w/o Ice Machine B = 30 - 39 F w/o Ice Machine D = 51 - 65 F w/o Ice Machine E = 20 - 29 F w/o Ice Machine 1 = 40 - 50 F w Ice Machine 2 = 30 - 39 F w Ice Machine 3 = 51 - 65 F w Ice Machine 4 = 20 - 29 F w Ice Machine S = Special	
Digit 5,6,7 - Nominal Capacity C20 = 20 Tons C25 = 25 Tons C30 = 30 Tons C40 = 40 Tons C50 = 50 Tons C60 = 60 Tons		
Digit 8 - Power Supply E = 200/60/3 P/S*** F = 230/60/3 4 = 460/60/3 P/S*** 5 = 575/50/3 9 = 380/50/3 D = 415/50/3 S = Special	Digit 12 - Agency Approval 0 = None 1 = UL/CSA	

Unit Nameplate

Unit Nameplate
One Mylar unit nameplate is located on the outside upper left corner of the control panel door. It includes the unit model number, serial number, electrical characteristics, weight, refrigerant charge, as well as other pertinent unit data. A small metal nameplate with the Model Number, Serial Number, and Unit Weight is located just above the Mylar nameplate, and a third nameplate is located on the inside of the control panel door.

Hazard Identification

WARNING – Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

! CAUTION – Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury. It may also be used to alert against unsafe practices.

CAUTION - Indicates a situation that may result in equipment or property damage only accidents.

Commonly Used Acronyms

For convenience, a number of acronyms and abbreviations are used throughout this manual. These acronyms are alphabetically listed and defined below.

A/D = Analog/Digital
BAS = Building Automation System
CAR = Circuit shutdown - Auto Reset
Cf = Evaporator limit control integrator
CGA = Air cooled - Cold Generator
UCM = Cold generator module. Contains I/O for most chilled solution functions.
Comp(s) = compressor(s)
Cond = condenser
Ckt = circuit
CLE = Chilled solution flow integrator
CMR = Circuit shutdown - Manual Reset
CRS = Control response setpoint
CSA = Canadian Standards Association
CCW = counterclockwise
CW = clockwise
DBZ = Width of Dead Band Zone
DDT = Design Delta-T setpoint
Delta T = The temperature difference between EST &
Diag = diagnostics
EST = Entering solution temperature
Ent = Entering

Ent = Entering
Echelon, LON, LONWORKS, LonBuilder, NodeBuilder, LonManager, LonTalk, Neuron, 3120, 3150, the Echelon logo, and the LonUsers logo are trademarks of Echelon Corporation registered in the United States and other countries. LonLink, LonResponse, LonSupport, LonMaker, and LonPoint are trademarks of Echelon Corporation.

General Information

Evap = Evaporator
Ext = External
GBAS = Generic Building Automation System Module
gfm = gallons per minute
HGBP = Hot gas bypass
HI = Human Interface
HO = History Only
HSLLS = Hot Start Load Limit setpoint
HVAC = Heating, Ventilation and Air Conditioning
IAR = Information only Auto Reset
IBTS = Ice Build Terminate Setpoint
ICS = Integrated Comfort System
IFW = Informational Warning
INFO = Information Only [Diagnostic]
I/O = Inputs/outputs
IOM = installation/operation/maintenance manual
IPC = Interprocessor communications
IPCB Module = Interprocessor communications bridge module
IRDT = Ice Rebuild Delay Timer
LCD = Liquid Crystal Display
LCI = LonTalk® Communication Interface
LCI-I = LonTalk® Communication Interface for Intellipak
LED = Light Emitting Diode
LH = left-hand
LonTalk = An open, device networking communications protocol for controls. This protocol is defined in ANSI approved standard EIA/CEA-709.1-A-1999.
LSC = Low Solution Temperature Cutout Setpoint
LPC = Low Pressure Cutout [Switch]
LST = Leaving solution temperature
MAR = Machine shutdown - Auto Reset
Max = maximum
MCM = Multiple circuit compressor module
Min = minimum
Misc = miscellaneous
MMR = Machine shutdown - Manual Reset
Mod = module
Mon = monitor
NCS = Number of capacity steps
num = number
OA = Outdoor air
OAT = Outdoor air Temperature
PAR = Partial System Disable, Auto Reset [Diagnostic]
PMR = Partial System Disable, Manual Reset [Diagnostic]
PRT = Pump Run Timer
PSIG = pounds-per-square-inch gauge pressure
PWM = Pulse width modulated
RAM = Random Access Memory
RTM = rooftop module
ROM = Read Only Memory
S/W = Software
Sat - saturated
SCM = single circuit compressor module
SCT = Saturated Condensing Temperature
Soln = solution
STP = setpoint
TCI Module = Trane communications interface module
Temp = temperature
UCM = Unit Control Modules
UL = Underwriter's Laboratories
VFD = Variable Frequency Drive
w.c. = water column
XL = across-the-line start

Glossary of Terms

Carefully review these definitions since they are used throughout this document and the I.O.M.. Knowledge of these terms is essential in gaining an understanding of how these units operate.

Active Setpoint

The setpoint which is currently being used for control by the setpoint source selection.

Comm3

Trane proprietary network communication protocol.

Comm5

Trane's implementation of LonTalk (an open network communication protocol.)

Chilled Solution Temperature Reset

A function that shifts the Leaving Solution Temp Setpoint an amount based on the value of another parameter—typically ZoneTemp, Entering Solution Temp or Outdoor Air Temp. The purpose of this function is to lower unit capacity to better meet load requirements.

Compressor Protection Switch

A pressure switch installed on the suction line that prevents compressor operation below the switch's setpoint.

Control Band

The range of temperatures or pressures which would normally be maintained by the various control functions.

Control Point

The value of a setpoint that an algorithm is using at any given time.

Deadband

As applied to LST control, this refers to a range of temperatures equally spaced above and below the CSS in which the control algorithm is satisfied. There is not adjustment of machine capacity within the deadband.

Emergency Stop

UCM binary input. Can be used for emergency shutdown of the unit by field-installed contacts. A diagnostic is produced when this input is open.

External Auto/Stop

A binary input on the UCM that allows the use of a field-supplied switch to perform normal unit on/off action.

Leaving Solution Setpoint

Active leaving solution setpoint. This setpoint is the control setpoint for process and comfort cooling.

Leaving Solution Temperature Control Point

The revised temperature setpoint after chilled solution temp reset has been applied.

LonTalk®

An open, device networking communications protocol for controls. This protocol is defined in ANSI approved standard EIA/CEA-709.1-A-1999.

Low Ambient Compressor Lockout

A function which prevents compressor operation at low outdoor ambient temperatures.

Remote Human Interface

A human interface module designed to be mounted remotely from the unit. There will be some functional differences between a unit mounted and a remote mounted human interface module.

Reset Amount Maximum

The maximum amount of reset allowed.

Reset End Temperature

The temperature at which the maximum reset amount will occur.

Reset Start Temperature

The temperature at which reset will begin.

Unit Control Module

This term is used to describe the set of electronic modules which make up the unit control system.

General Information

UCM Control System

Trane Large Commercial Cold Generator Units are controlled by a microelectronic control system that consists of a network of modules and are referred to as Unit Control Modules (UCM).

The unit size, peripheral devices, options, etc... determine the number and type of modules that a particular unit may employ.

The UCM receives analog and binary inputs, then processes this information and supplies outputs in the form of modulating voltages, contact closures, etc... to control damper actuators, fan motors, compressors, valves, and other electrical devices in the system to maintain set temperature levels.

The UCM provides some equipment protection functions both directly and indirectly, such as chilled water flow and compressor lockouts.

Listed below are the various modules that may be employed in a UCM control system.

Cold Generator Module (1U48) (CGM - Standard)

The Cold Generator Module (CGM) responds to cooling requests by energizing the proper unit components based on information received from other unit modules, sensors, remote panels, and customer supplied binary inputs. It initiates unit operation based on that information.

Compressor Module (1U49) (MCM)

The Compressor module, (Single Circuit & Multiple Circuit), upon receiving a request for mechanical cooling, energizes the appropriate compressors and condenser fans. It monitors the compressor operation through feedback information it receives from various protection devices. It also provides heat tape output control for heat exchanger protection.

Interprocessor Communications Board (1U55) (IPCB - used with Optional Remote Human Interface)

The Interprocessor Communication Board expands communications from the unit's UCM network to a Remote Human Interface Panel. DIP switch settings on the IPCB module for this application should be; Switches 1 and 2 "Off", Switch 3 "On".

Trane Communications Interface Module (1U54) (TCI - Optional - used with Trane ICS™)

The Trane Communication Interface module expands communications from the unit's UCM network to a Trane Tracer 100™ or a Tracer Summit™ system and allows external setpoint adjustment and monitoring of status and diagnostics.

DIP Switch settings on the TCI module for these applications should be:

Switches 1, 2, and 3 are "Off"

Generic Building Automation System Module (1U51 = GBAS 0-5V, 1U98 = GBAS 0-10V) (Optional - used with Non-Trane Building Control System)

The Generic Building Automation System (GBAS) module allows a non-Trane building control system to communicate with the unit and accepts external setpoints in form of analog inputs (0 - 5 DCV or 0 - 10 DCV depending on the module selected) and a binary Input for demand limit. Five (5) binary outputs are available on 0 - 5 DCV modules. One (1) binary output and four (4) analog outputs are available on the 0 - 10 DCV modules. Refer to the "Field Installed Control Wiring" section for the control wiring to the GBAS module and the various desired setpoints with the corresponding DC voltage inputs.

LonTalk Communication Interface Module (1U54)

(LCI Optional - used on units with Trane ICS™ or 3rd party Building Automation Systems)

The LonTalk Communication Interface module expands communications from the unit's UCM network to a Trane Tracer Summit™ or a 3rd party building automation system, that utilizes LonTalk, and allows external setpoint and configuration adjustment and monitoring of status and diagnostics.

Current Sensing Module (1U90) (CSM - Optional)

Current transformers located around two (2) of the main power leads for each compressor monitors the running current during compressor operation. The information is sent to the UCM and can be accessed through the "Compressor Status" submenu displayed at the Human Interface Module.

Superheat & Subcooling Module (1U91) (SSM - Optional)

Monitors the system operating superheat and subcooling through the use of pressure transducers, liquid line, and suction line temperature sensors. The information is sent to the SSM and can be accessed through the "Compressor Status" submenu displayed at the Human Interface Module.

Power Disconnecting Switches

Manual Disconnect Switch

(Optional 1S14) Manual disconnect switch 1S14, located in the unit control panel, instead of the power terminal block 1TB1, allows the operator to disconnect power from the unit's "high" voltage (200V-575V) section, the 115V section, and the 24V section without having to open the control panel door. A description of its features and operation are given in the Installation, Operation, & Maintenance manual.

115V Control Circuit Switch (1S1)

Control circuit switch (1S1) is provided on all units and is located downstream of the 115V transformer 1T1. It allows the operator to disconnect power from the unit's 115V control components by placing the switch in the "Off" position.

24V Transformer Switch (1S70)

Transformer switch 1S70 is provided on all units and is located downstream of 24V transformers 1T2 and 1T3. It allows the operator to disconnect (24V) power from all of the unit's control modules by placing the switch in the "Off" position.

For a complete description of the 24V components and operation, refer to the latest edition of the applicable Installation, Operation and Maintenance manual listed on the unit nameplate.

General Information

Human Interface Module

(1U65 = Local 6U66 = Remote)

The Human Interface (HI) Module illustrated in Figure 1 is the device which enables the customer, building owner, or contractor, to communicate to the unit the necessary parameters for unit operation.

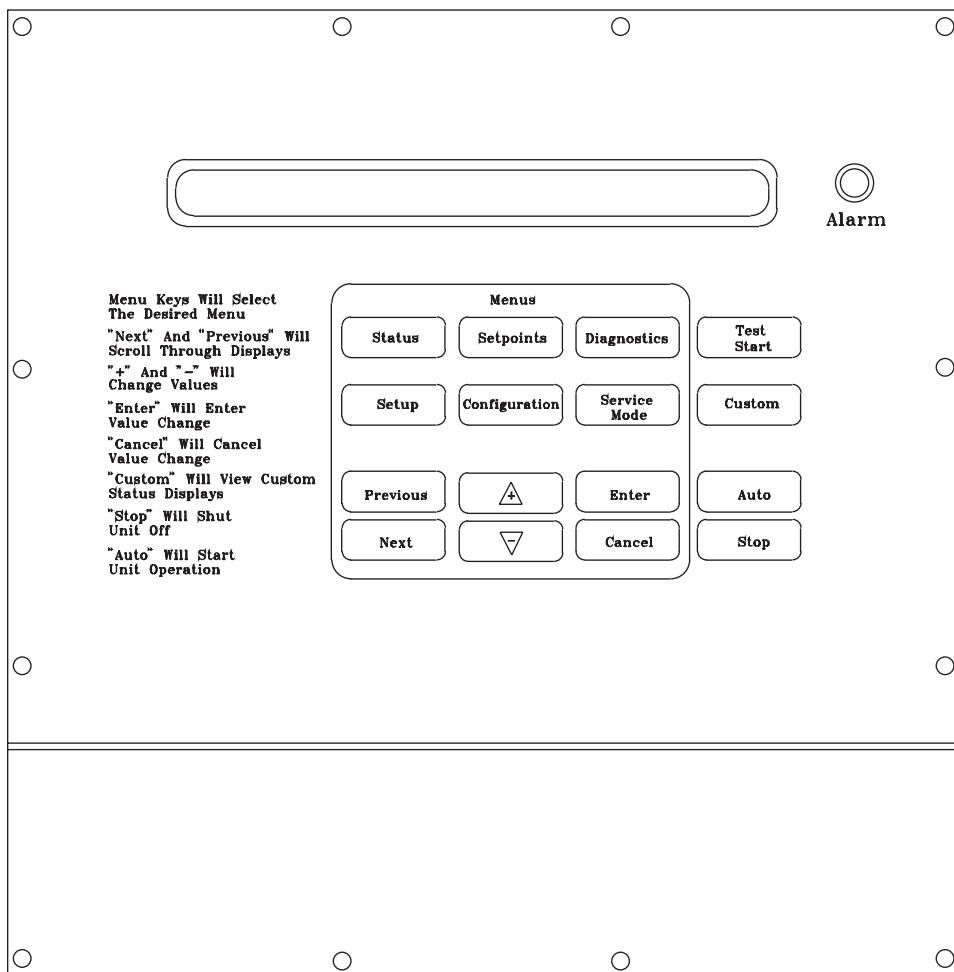

The local (unit mounted) Human Interface and the Remote Human Interface Panels' functions are identical, except for Service mode which is not available on the Remote Human Interface Panel.

The local HI Module is located in the unit's main control panel. A small door located in the unit's control panel door allows access to the HI Module's keypad and display window.

There is a 2 line by 40 character LCD screen which provides status information for the various unit functions as well as menus used to set or modify the operating parameters. There is a 16 key keypad adjacent to the LCD screen which allows the operator to scroll through the various menus and make adjustments to the setpoints, etc...

The information displayed in the LCD window will be top level unit status information unless the operator initiates other displays.

Figure 1
Human Interface Module

General Operation

At power-up, the Human Interface LCD will display one of three initial screens illustrated in the "General Status" section.

1. Unit Status (Unit Off or Stopped) (The unit is configured and operational, but is not running). This screen shows state, mode, and function information when the unit is off or stopped.
2. Unit Status (Unit On) (The unit is configured and operational, and is running). This screen shows state, mode, and function information when the unit is on.
3. No Configuration (the unit needs to be configured). This screen shows that required configuration data is missing.

The LCD screen has a backlight that makes the information easier to read. The light will go out if no keys are pressed for 30 minutes. If it goes out, simply press the STATUS key.

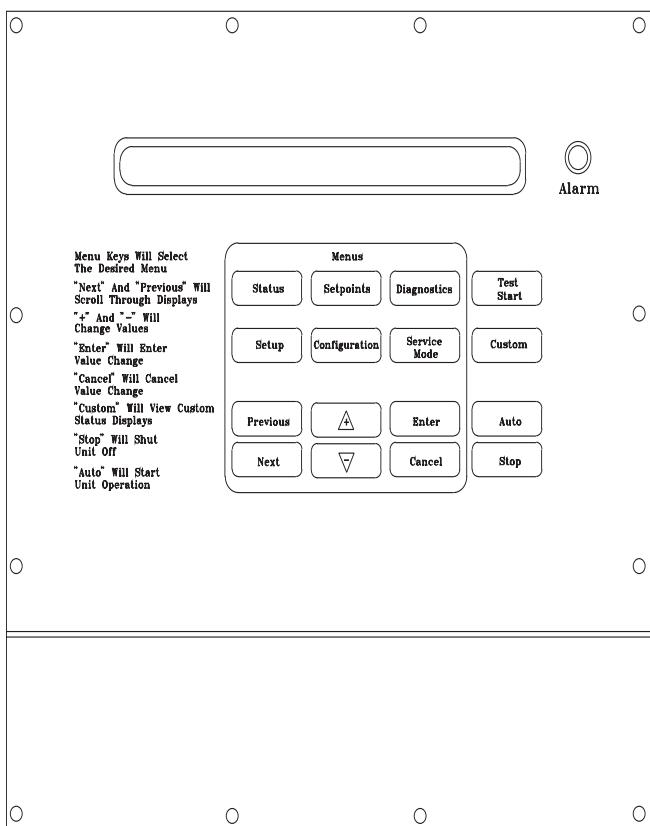

General Information

Menu Keys

The six keys illustrated in Figure 2 in the MENU area (STATUS, SETPOINTS, SETUP, CONFIGURATION, DIAGNOSTICS, and SERVICE MODE) are used to bring up the various interactive menus where the user inputs and accesses unit operating data. Pressing these keys will display the initial screen for the menu designated by the key's name. The following information describes the keys and their functions when viewing the various menus.

If no key is pressed for 30 minutes while the LCD is displaying a menu screen, it will revert back to the unit operating status screen.

Figure 2
Human Interface Keypad

STATUS Key

Pressing the STATUS key causes the LCD to display the operating status screen; i.e. "On", "Unit Stop", "External Stop", "Emergency Stop", "Service Mode". Pressing the NEXT key allows the operator to scroll through the screens which provide information such as air and refrigerant temperatures, pump operation, compressor operation, as well as active cooling and compressor lockout setpoints. Pressing the STATUS key while viewing any of the data screens will cause the LCD to go back to the operating status screen.

SETPOINTS Key

Pressing the SETPOINTS key will cause the LCD screen to display the first of the setpoint screens where the operator will designate default temperature setpoints and setpoint source information. While scrolling through the setpoint screens, pressing this key again will cause the LCD to display the first setpoint screen.

DIAGNOSTICS Key

Pressing the DIAGNOSTICS key at any time will allow the operator to view any unit function failures. The LCD screen will display one of the diagnostic screens (depending on which diagnostic, if any, is present). If no key is pressed for 30 minutes while the screen is displaying diagnostic information, it will revert back to the operating status display.

CONFIGURATION Key

Pressing the CONFIGURATION key will cause the LCD screen to display the first of the configuration screens where the operator will designate unit configuration data such as unit type, capacity, installed options, etc...

This information was programmed at the factory. Pressing the configuration key at any level in the configuration menu will display the first configuration screen.

Note: This key should be used if the unit's configuration data is lost or new options are added in the field, and to view current configuration.

SETUP Key

Pressing the SETUP key will cause the LCD screen to display screens where the operator will designate various operating parameters such as temperature ranges, limits, percentages, etc. for the control of the unit's various operating modes. Pressing the SETUP key at any level in the SETUP menu will display the first SETUP screen.

SERVICE MODE Key

Pressing the SERVICE MODE key causes the LCD to display the first of the service test mode screens showing various unit components which may be turned on or off for the particular test being performed. Once the status of these components is designated, the LCD will display screens that allow the operator to designate the TEST START time delay for each test.

Data Manipulation Keys

The six data manipulation keys illustrated in Figure 2, (ENTER, CANCEL, + (Plus), - (Minus), PREVIOUS, and NEXT) are used to modify the data within the screens (change values, move the cursor, confirm choices, etc...)

ENTER Key

This key will confirm the new values that were designated by pressing the + (Plus) or - (Minus) keys at all edit points. When viewing status and diagnostics screens, it has no function.

CANCEL Key

After changing data, at an editable screen, but before confirming it with the ENTER key, pressing the CANCEL key will return the data to its previous value. This key shall also function to clear active diagnostics.

General Information

+ (Plus) Key

When viewing a setpoint screen, this key will increase the temperature or pressure value of the setpoint. When working with a status menu, it will add the current status display to the custom menu. When viewing the setup or service test screens, it will increase setpoints or toggle choices On or Off at each edit point.

- (Minus) Key

This key when viewing the setpoint screen will decrease the temperature or pressure value of the setpoint. When viewing the setup or service test screens, it will decrease setpoints or toggle choices On or Off at each edit point. When viewing the custom menu, pressing the - (Minus) key will remove the status screen from the custom menu. When viewing diagnostics screens it has no function.

PREVIOUS Key

Pressing the PREVIOUS key causes the LCD to scroll backwards through the various displays for each menu. At displays with multiple edit points, it moves the cursor from one edit point to another.

NEXT Key

Pressing the NEXT key causes the LCD to scroll forward through the various displays for each menu. At displays with multiple edit points it moves the cursor from one edit point to another.

Unit Operation Keys

AUTO Key

Pressing the AUTO key at any time will cause the display to go to the top level status display and, if the unit is shutdown, will cause the unit to begin operation in the appropriate mode no matter what level in the menu structure is currently being displayed. If the current display is an editable display, the AUTO key will confirm the desired edit.

STOP Key

Pressing the STOP key will cause the unit to transition to the stop state. If the current display is editable, pressing the STOP key will cancel the desired edit.

TEST START Key (SERVICE)

Pressing this key while viewing any screen in the SERVICE Mode menu will start the service test. When viewing status, setup, setpoint, and diagnostics screens, it has no function.

CUSTOM Key

The Custom menu is simply a status menu that contains screens that the user monitors most frequently. The Custom menu can only contain five status screens. To create the Custom menu, press the STATUS key, followed by the NEXT key (this brings up the initial status screen). If you want to add this screen to the Custom menu, press the + (Plus) key, if not, press the Next key again until a status screen appears that you would like to add to the Custom menu. Pressing the + (Plus) key while viewing any of the various status screens will add that screen to the Custom menu. Once the Custom menu is programmed it can be accessed by pressing the CUSTOM key. To remove a status screen from the Custom menu, press the CUSTOM key, then press the NEXT key until the status screen that you want to remove appears, then press the - (Minus) key.

After adding a screen to the Custom menu, the following screen is displayed:

"Item Added to Custom Menu"

If the + (PLUS) key is pressed and the Custom menu is full, the following screen is displayed:

"Custom Menu Is Full"

After deleting a screen from the Custom Menu, the following screen is displayed:

"Item Deleted from Custom Menu"

If the CUSTOM key is pressed and there are no entries, the following screen is displayed:

No items are selected for Custom Report
See Operators Manual to select entries

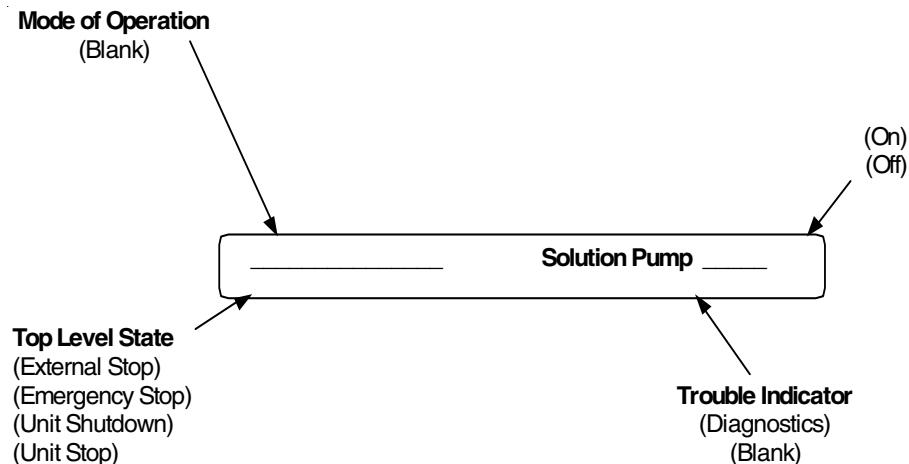

General Information

General Status Display

Anytime the unit is powered up, or the STATUS, AUTO, or STOP keys are pressed, the unit mounted Human Interface will display one of the following three general status display screens. The operator will then be able to enter keystrokes which will allow him to navigate through a set of menus and submenus in order to provide/access various monitoring, setup, and configuration information. The Human Interface will not display screens or parts of screens for which the unit is not configured.

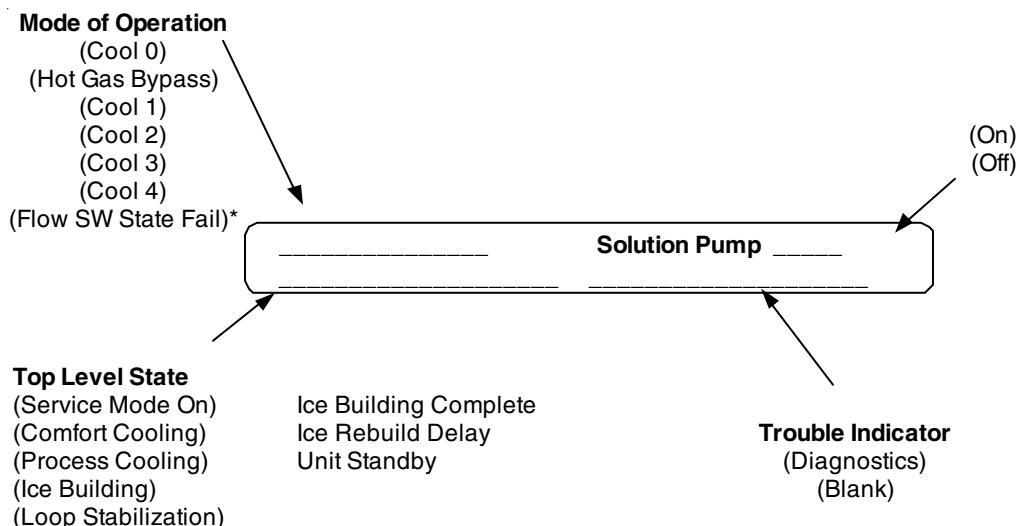

Unit "Off" or "Stopped"

If at power up the unit is not running, the following display will appear on the Human Interface LCD screen. When this screen is being displayed, the only functional keys are the six menu keys (STATUS, SETPOINTS, DIAGNOSTICS, SETUP, CONFIGURATION, AND SERVICE MODE), the AUTO key, the CUSTOM key, and the STOP key.

Unit "On"

If the unit has entered an operating state (running), the following display will appear on the Human Interface LCD screen. When this screen is being displayed, the only functional keys are the six menu keys (STATUS, SETPOINTS, DIAGNOSTICS, SETUP, CONFIGURATION, AND SERVICE MODE), the AUTO key, the CUSTOM key, and the STOP key.

*Service Test Mode Only - Flow switch failed to open after solution pump turned off.

No Configuration

If at power up the unit has not been programmed with the necessary configuration data for normal unit operation, the following display will appear on the Human Interface LCD screen. When this screen is being displayed, the only functional key is the CONFIGURATION key.

No Configuration Present
Press Configuration Key

Note: This screen will only appear when the CGM has been field replaced. Refer to the Configuration Menu.

General Information

Factory Presets

The CGM controlled unit has many operating functions whose settings are preset at the factory, but may be modified to meet the unique requirements of each job. The following list identifies each of the unit's adjustable functions and the value assigned to it. If these factory presets match your application's requirements and the "System Start-Up" procedures in the Installation, Operation & Maintenance manual has been completed, simply press the AUTO key at the Human Interface module to begin unit operation.

If your application requires different settings, turn to the listed page beside the function, press the designated function menu key, then press and hold the NEXT or PREVIOUS key until its screen appears on the LCD. Once the proper screen appears, simply follow the programming instructions given below the applicable screen in this manual.

Note: Record any changes made to the factory preset values in the corresponding space provided.

General Information

Password Protected Screens

Some of the operating displays on the Human Interface LCD screen are intended to be accessed by qualified users only, and require a password to change. The following screens display the various programming sections that require a password in order to view or to modify the preset operating parameters. The password for each screen is a different series of + (Plus) or - (Minus) key strokes in a predefined sequence. Shown below are the password protected screens, and the passwords for accessing them.

The following screens display the various programming sections that require a specific PASSWORD to be entered by a qualified operator in order to view or to modify the operating parameters.

The following screen will appear if the PASSWORD is not entered within approximately 15 seconds.

Password Entry Time Limit Exceeded

1. Press the NEXT key until the following screen is displayed.

Configuration is Password Protected
Please Enter Password:

2. Press the + or - keys in this sequence (+ - - -) to access this restricted screen.
3. Press the ENTER key to confirm the password and enter the menu.
4. Press the NEXT key until the following screen is displayed.

Diagnostic Reset is Password Protected
Please Enter Password:

1. Press the + or - keys in this sequence (- + +) to access this restricted screen.
2. Press the ENTER key to confirm the password and Lock the definitions.
3. Press the NEXT key until the following screen is displayed.

Diagnostic Log is Password Protected
Please Enter Password:

1. Press the + or - keys in this sequence (- + + -) to access this restricted screen.
2. Press the ENTER key to confirm the password and Lock the definitions.
3. Press the NEXT key until the following screen is displayed.

System Operating Status

STATUS Menu

The STATUS menu is used to view various operating conditions such as temperatures and humidity levels. It's used to view unit component status such as fan, compressor, heater, and economizer operation, as well as setpoint status.

The screens shown in this section are for example only. Pressing the + (Plus) key while viewing any of the status display screens will add that screen to the Custom menu. When a status screen is displayed for 30 minutes without a key being pressed, the LCD screen will revert to the general operating status display. If this happens, press the STATUS key again to return to the status menu. The following are examples of status screens that may be viewed by pressing the STATUS key.

Press the STATUS key to enter into the status menu. The "STATUS MODE" will automatically return to the power up screen after 30 minutes, if no keys are pressed.

Cool 0 Standby	Solution Pump Off Diagnostics
-------------------	----------------------------------

1. Press the NEXT key to scroll forward through the status screens.
2. Press the PREVIOUS key to scroll backwards to view previously displayed status screens.
3. Press the + (Plus) key while viewing any status screen to add that screen to the custom menu. Refer to the custom menu for the creation and maintenance of customized menus.

Active Leaving Solution Setpoint 55.0 F
Temp: Entering 55.0 F Leaving 50.0 F

Ckt2 sat liquid temperature
ICS Defined temperature
Outside air temperature
Active Cooling Capacity

System Programming SETUP

After the unit is installed, the CGM must be programmed with certain setup information (chilled solution setpoints, ON and OFF times, system defaults, setpoint sources, etc...) in order to operate and function properly. The data necessary for unit operation will vary depending on certain factors such as unit size, type, and installed options.

This section of the manual provides step by step instructions for programming this information. Also provided are instructions for checking unit operating status, accessing and clearing diagnostics, and performing service tests.

Some of the displays shown in this manual may not appear on the Human Interface (HI) LCD screen during programming. Only the applicable screens for the specific unit options and operating parameters will be displayed.

Start with the first setup screen in the SETUP menu and program the necessary information by completing the steps located below each illustrated window. Information that pertains to when the screens are applicable, the factory preset values, and the possible values that may be designated is located to the right of each programmable screen.

Ignore the steps that do not apply to your unit and application, and move on to the next applicable set of instructions in the manual. Continue this process until all applicable screens are programmed with the required information.

SETUP Menu

The setup menu is used to input initial operating information such as control parameters, functions enable/disable, text display (language), temperature display (C or F), and system tuning parameters. When a setup screen is displayed for 30 minutes without a key being pressed, the LCD screen will revert to the appropriate power-up display. If this happens, press the SETUP key again to return to the setup menu.

1. Press the SETUP key to display the following screen.

Display Text in	ENGLISH	LANGUAGE
Display Units in	ENGLISH	

Used on Units: All

Possible Values: Text = English, French, Spanish

System Configuration

CONFIGURATION Menu

The CGM controlled unit has many operating functions whose settings are preset at the factory. The following configuration programming steps are provided for those cases where the Human Interface module has been replaced after the unit has been in operation and must be reconfigured.

Press the CONFIGURATION key to display the following screens. Check the unit model number and compare it to the data that is displayed in the following screens

Configuration - Model Num Digit	5,6,7
Unit Capacity	50

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.
3. Press the NEXT key until the following screen is displayed.

Configuration - Model Num Digit	8
Line Voltage	460 VAC

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.
3. Press the NEXT key until the following screen is displayed.

Configuration - Model Num Digit	11
Ice Building Control	INSTALLED

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.
3. Press the NEXT key until the following screen is displayed.

Configuration - Model Num Digit	11
Leaving Solution STP Range	40 - 50 F

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.
3. Press the NEXT key until the following screen is displayed.

Configuration - Model Num Digit	13+
Hot Gas Bypass Option	INSTALLED

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.
3. Press the NEXT key until the following screen is displayed.

Configuration - Model Num Digit	13+
GBAS 0-5VDC Module	INSTALLED

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.
3. Press the NEXT key until the following screen is displayed.

Configuration - Model Num Digit	13+
GBAS 0-10VDC Module	INSTALLED

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.
3. Press the NEXT key until the following screen is displayed.

Configuration - Model Num Digit	13+
Superheat/Subcool Module	INSTALLED

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.

Refer to the Model number stamped on the unit nameplate located on the control panel door while scrolling through the configuration screens. Certain digits of this alpha/numeric model number provide information that must be entered at the Human Interface (HI) in order for the CGM network to operate properly.

System Testing & Troubleshooting

SERVICE MODE Menu

The SERVICE MODE menu is used to input operating parameters for unit operation during a service test. Depending on the particular test being conducted, the user will cycle through all unit outputs (compressors, fans, pump, etc...) and selectively turn them On or Off for the test. After designating the operating status for each unit component, the operator will designate the "TEST START" delay time.

When a service mode screen is displayed for 30 minutes without a key being pressed, the LCD screen will revert to the general operating status display. If this happens, press the SERVICE MODE key again to return to the service menu.

To operate the system in the TEST MODE, press the SERVICE MODE key to enter into the service mode menu and scroll through all of the system outputs and selectively turn them "On" or "Off".

CGM Evap Solution Pump Relay: OFF

1. Press the + or - key until the proper value is displayed.

3. Press the NEXT key until the following screen is displayed.

CGM Ice Build Relay Output : OFF

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.
3. Press the NEXT key until the following screen is displayed.

GBAS 0-5VDC Module Relay Outputs

#1 OFF #2 OFF #3 OFF #4 OFF #5 OFF

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.
3. Press the NEXT key to advance the cursor to the "#2 Output"
4. Press the + or - key until the proper value is displayed.
5. Press the ENTER key to confirm this choice.
6. Repeat steps 1 - 4 for Outputs 3, 4 & 5.
7. Press the NEXT key until the following screen is displayed.

GBAS 0-10VDC Module Relay Output: OFF

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.
3. Press the NEXT key until the following screen is displayed.

GBAS 0-10VDC Module Analog Outputs

Out #1 0.2 VDC Out #2 0.4 VDC

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.
3. Press the NEXT key to advance the cursor to the "#2 Output"
4. Press the + or - key until the proper value is displayed.
5. Press the ENTER key to confirm this choice.
6. Press the NEXT key until the following screen is displayed.

GBAS 0-10VDC Module Analog Outputs

Out #3 0.6 VDC Out #4 0.8 VDC

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.
3. Press the NEXT key to advance the cursor to the "#4 Output"
4. Press the + or - key until the proper value is displayed.
5. Press the ENTER key to confirm this choice.
6. Press the NEXT key until the following screen is displayed.

CGM ICS Controlled Relay: OFF

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.

Used on Units: With Ice Building Control Option

Possible Values: On, Off

Used on Units: With GBAS 5VDC Module Option

Possible Values: On, Off

Used on Units: With GBAS 10VDC Module Option

Possible Values: On, Off

Used on Units: With GBAS 10VDC Module Option

Possible Values: 0.0 to 10.0 VDC

Used on Units: With GBAS 10VDC Module Option

Possible Values: 0.0 to 10.0 VDC

Used on Units: With TCI Module Option (For Future Use)

Possible Values: On, Off

System Testing & Troubleshooting

3. Press the NEXT key until the following screen is displayed.

**Start Test in 5 Sec
Press TEST START To Begin, STOP To Halt**

Used on Units: All Units
Possible Values: 5 to 255 seconds

1. Press the + or - key until the proper value is displayed.
2. Press the ENTER key to confirm this choice.

The following screen will be displayed after pressing the "TEST START" key if a SERVICE MODE screen has been displayed during the previous 60 minutes.

**Test Start In 5 Sec
Press STOP To Halt**

Used on Units: All Units
Possible Values: 120 to 0 Seconds

If a screen has not been displayed during the SERVICE MODE procedure for 60 minutes and the TEST START key is pressed, the following screen will be displayed.

**Press SERVICE MODE
To Review Selections**

Used on Units: All Units

When the START TEST timer expires, this screen will be displayed at the unit mounted Human Interface and at the remote mounted Human Interface, if installed.

**Service Test Is Active
Press STOP To Halt**

Used on Units: All Units

Note: There is no time-out period when the unit is operating in the SERVICE TEST mode. Press the "STOP" or "AUTO" key to discontinue the Service Test. Only the STATUS, CUSTOM, SERVICE MODE, DIAGNOSTICS, and STOP keys are functional once the TEST START key has been pressed.

After pressing the STOP or AUTO key, the following screen is displayed

**Service Mode, STOP SYSTEM Restart
Communicating With Unit. Please Wait**

and then the following screen is displayed:

**Updating Unit Data. Please Wait
TRANE INTELLIPAK**

and then the top level status screen is displayed.

System Testing & Troubleshooting

DIAGNOSTICS Menu

The DIAGNOSTICS menu is used to view diagnostics that have resulted from system failures within the unit. There are two lists where diagnostics reside; the Active list, and the Diagnostic Event Log.

The Active list is used for viewing all active diagnostics and for clearing manually resettable diagnostics. This list of diagnostics are displayed after pressing the DIAGNOSTICS key if active diagnostics are present.

Active manual diagnostics can be cleared in batch form at the unit mounted Human Interface. When an Active diagnostic is manually or automatically cleared, it is removed from this buffer. Automatically resetting diagnostics can not be reset by the Human Interface, because the condition which caused the diagnostic has to be corrected for the diagnostic to clear.

The word "MORE" is displayed on all screens if more than one diagnostic exists, except for the last diagnostic. Upon reaching the last diagnostic, the word "MORE" disappears. Pressing the NEXT key at this point causes the display to advance to the first diagnostic in the Diagnostic Event Log.

The Diagnostic Event Log screens are displayed after scrolling through the Active list or after pressing the DIAGNOSTICS key when no active diagnostics are present. It's used to view the past 20 diagnostics. Diagnostics in this

log are stacked in inverse chronological order, with the first diagnostic screen being the most recently reported diagnostic.

When a new diagnostic is displayed, the words "NOT VIEWED" are displayed with it. After viewing the last unviewed diagnostic, the words "NOT VIEWED" change to "VIEWED" for every diagnostic in the log. The diagnostic will remain this way as long as it is in the log. This allows the operator to distinguish between old and new diagnostics in the Event Log.

Pressing the NEXT key after reaching the last diagnostic in the Event Log advances the display to the first diagnostic in the Active list if any exist. If not, the display reverts back to the first Event Log diagnostic. If the Diagnostic Event Log is full (20 events), and another diagnostic occurs, the oldest diagnostic is pushed off the end of the list. If all 20 diagnostics in the list are active when the 21st occurs, then the oldest Active diagnostic is pushed off the end of the list. When an Active diagnostic is automatically or manually cleared in the Active buffer, its status in the Diagnostic Log changes from Active to History. If the operator does not clear an active diagnostic in the Active log, its status will still show as Active in the Diagnostic Log.

When a diagnostic screen is displayed for more than four hours without a key being pressed, the screen will return to the operating status display.

One of the following screens will be the first screen displayed when the DIAGNOSTIC" key is pressed.

**Diagnostic Menu ---- Info
No Active Diagnostics (NEXT) History Log**

OR

**Press CANCEL to Clear All Active Manual
Diagnostics, or Press NEXT to View**

1. If there are active diagnostics, pressing the "CANCEL" key to clear the diagnostics will prompt the following screen.

**Diagnostic Reset Is Password Protected
Please Enter Password:**

1. Press the + (Plus) or - (Minus) keys to enter the password
2. Press the ENTER key to confirm this choice. When the correct password is entered, the following screen will be displayed.

Used on Units: All Units

Possible Values: + (Plus) and - (Minus)

System Testing & Troubleshooting

Resetting Active Manual Diagnostics
Sending Reset Request

and then the following screen will be displayed

Resetting Active Manual Diagnostics
Updating Unit Data, Please Wait

and then the following screen will be displayed

Active Diagnostic --- Info
"Please Wait... Unit Is In Reset Mode"

OR

3. Pressing the "NEXT" key to view the diagnostics will prompt the following screen if a "MANUAL RESET" failure has occurred.

Active Diagnostic --- Manual Reset

More

Used on Units: All Units

The word MORE will only appear if more than one failure has occurred.

Possible Values:

Comp Contactor Fail - Ckt 1

Evap Leaving Solution Temp Sensor Fail

Comp Contactor Fail - Ckt 2

Evap Entering Solution Temp Sensor Fail

Comp Prot - LPC Open (Ckt 1)

Evap Solution Flow Loss

Comp Prot - LPC Open (Ckt 2)

Hot Start Load Limit (Man)

Compressor Trip - Ckt 1

Low Solution Cutout Temp (Man)

Compressor Trip - Ckt 2

Low Pressure Control Open - Ckt 1

Emergency Stop

Low Pressure Control Open - Ckt 2

OR

Pressing the "NEXT" key to view the diagnostics will prompt the following screen if an "AUTO RESET" failure has occurred.

Used on Units: All Units

Active Diagnostic --- Auto Reset

More

The word MORE will only appear if more than one failure has occurred.

Possible Values:

CGM OA Temp Sensor Failure,

IBTS Adjusted to Maintain Min Diff

CGM Zone Temp Sensor Failure,

Ice Build Terminate Setpoint Fail

Cond Temp Sensor Failure - Ckt 1,

Leaving Solution Setpoint Fail

Cond Temp Sensor Failure - Ckt 2,

Low Ambient Evap Solution Pump Override

Current Sensing Module Comm Fail

Low Solution Cutout Temp (Auto)

Evap Solution Flow Proving Switch

LSS Adjusted to Maintain Min Diff

Ext. Leaving Solution STP Input Fail

MCM Communications Failure

GBAS 0-5V Module Comm Failure

SCM Communications Failure

GBAS 0-10V Module Comm Fail

BAS Module Comm Failure

Hot Start Load Limit (Auto)

BAS/NETWORK Comm Failure

Hot Start Load Limit STP Fail

Unit HI Communications Failure

OR

Pressing the "NEXT" key to view the diagnostics will prompt the following screen if an "Information Only" failure has occurred.

System Testing & Troubleshooting

Active Diagnostic ---- Info

More

The word MORE will only appear if more than one failure has occurred.

If additional active diagnostics are present, pressing the NEXT key will display them.

Possible Values:

CGM ICS Temperature Sensor Fail
CGM Module Data Storage Error
EST/LST Low Temperature Indication
Hot Start Load Limit (Info)
Liquid Pressure Sensor Fail Ckt 1
Liquid Pressure Sensor Fail Ckt 2
Pumpdown Terminated By Time Ckt 1
Pumpdown Terminated By Time Ckt 2

Sat Liquid Temp Sensor Fail Ckt 1
Sat Liquid Temp Sensor Fail Ckt 2
Suction Pressure Sensor Fail Ckt 1
Suction Pressure Sensor Fail Ckt 2
Suction Temp Sensor Fail Ckt 1
Suction Temp Sensor Fail Ckt 2
Superheat/Subcool Module Fail

After viewing all active diagnostics, pressing the NEXT key will display the following screen

Log 1

Pressing the NEXT key will display each successive log entry.

1. Pressing the "CANCEL" key to clear the diagnostics log will display the following screen.

Diagnostic Log Is Password Protected
Please Enter Password:

1. Press the + (Plus) or - (Minus) keys to enter the password
2. Press the ENTER key to confirm this choice. When the correct password is entered, the following screen will be displayed.

Active Diagnostics
"Please Wait . . . Updating Diagnostic Log"

If the "DIAGNOSTIC LOG" is empty when the "CANCEL" key is pressed, the following screen will be displayed.

Active Diagnostics ---- Info
"Diagnostic Buffer Is Already Empty !"

Press the AUTO or STOP key to return to the top level status screen.

Used on Units: All Units

Used on Units: All Units

Possible Values: Log Number 1-20, Viewed or Not Viewed, Active or History, Manual, Auto, or Info., Any diagnostic listed under the previous screens associated with the type of diagnostic.

Used on Units: All Units

Possible Values: + (Plus) and - (Minus)

Used on Units: All Units

Possible Values: Manual, Auto, or Info

Used on Units: All Units

Possible Values: Manual, Auto, or Info

Failure Modes

When any condition results in the unit's inability to perform a normal function, it is said to have entered a failure mode. There are two types of failure modes.

1. An "Analog input out of range" failure mode.

This failure mode occurs when a sensing device such as a temperature sensor begins to transmit information that is outside its allowable range.

2. A "Fault recognition by input logic" failure mode. This failure mode occurs when the UCM receives information that does not "make sense" or does not conform to its predefined logic.

System Testing & Troubleshooting

Communications Link Problems

If one of these messages appear on the Human Interface screen, that Human Interface is not communicating with the unit.

LOCAL HI COMMUNICATIONS LOSS

CHECK COMM LINK WIRING BETWEEN MODULES

Used With: All Units with Local HI

Problem: The Unit Mounted (Local) Human interface has lost communications with the CGM. See "Fail Diagnostic" for additional information.

Check: Wiring between Unit Mounted (Local) Human Interface and CGM. Verify crimping and polarity of communications wiring. There should be no loose connections or crimps on wire insulation.

OR

REMOTE HI COMMUNICATIONS LOSS

CHECK COMM LINK WIRING TO UNIT NUMBER 3

Used With: All Units with Remote Human Interface

Possible Values: Unit Number 1 through 4

Problem: The Remote Human Interface has lost communications with the unit whose number is specified (#3 in this example).

Check: Field/unit wiring between Remote Human Interface and the IPCB on the unit number specified. Also, verify wiring between the IPCB and CGM of the unit whose number is specified. Verify crimping and polarity of communications wiring. There should be no loose connections or crimps on wire insulation.

If one of these messages appear on the Human Interface screen, the link is noisy or there is another Human Interface of the same type on the link.

Improper Human Interface Configuration

More than one Local HI on link

Used With: All Units with Local HI

Problem: Noisy Communications link or a second Local HI has been installed on the link.

Check: Wiring between Unit Mounted (Local) Human Interface and CGM. Verify crimping of communications wiring. There should be no loose connections or crimps on wire insulation. If a Remote HI was installed, verify that a Local HI was not installed by mistake.

OR

Improper Human Interface Configuration

More than one Remote HI on link

Used With: All Units with Remote Human Interface

Problem: Noisy Communications link or a second Remote HI has been installed on the link.

Check: Field/Unit wiring between Remote Human Interface and the IPCB and CGM. Verify crimping of communications wiring. There should be no loose connections or crimps on wire insulation. Verify that no other Remote HI's have been connected to the same communications link/unit.

Diagnostics

There are four types of diagnostics:

1. (PMR) Partial System Disable, Manual Reset
2. (PAR) Partial System Disable, Auto Reset
3. (INFO) Information Only
4. (HO) History Only

The following Troubleshooting chart lists possible Failure Modes and:

1. The Diagnostic Displayed on the Human Interface's LCD screen and if it is a PMR, PAR, INFO or HO diagnostic.
2. The condition which caused the failure mode to occur or the Reason for Diagnostic.
3. The LCM's Reaction to the failure mode.

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
CGM ICS Temperature Sensor Fail Problem: CGM is receiving a signal which is out of range from the CGM ICS Temperature Sensor input.	The unit is reading a signal that is out of range for the CGM ICS Temperature sensor input on the CGM. (Temp < -40 F or Temp > 200 F).	No change in unit operation occurs. This diagnostic is for information only.	(INFO) An automatic reset occurs after the CGM ICS Temperature Sensor returns to its allowable range. In order to prevent rapid cycling of the diagnostic, there is a 10 second delay prior to the
CGM Module Data Storage Error Problem: There was a data transmission error.	An error occurred while the CGM was writing data to its internal non-volatile memory (EEPROM).	An information only diagnostic will be displayed at the Human Interface.	(INFO) A manual reset may be made at the Human Interface, at Tracer, or by cycling power to the CGM.
CGM OA Temp Sensor Failure Problem: The Outside Air Temperature sensor input is out of range.	Check: This can be caused by an intermittent power loss. Turn the unit off for 1-2 minutes, then back on again. If diagnostic persists, then the CGM may need to be replaced.	The unit is reading a signal that is out of range for the Outside Air Temperature sensor input on the CGM. (Temp < -40 F or Temp > 200 F).	(PAR) An automatic reset occurs after the OA Temp input returns to its allowable range. In order to prevent rapid cycling of the Diagnostic, there is a 10 second delay before the automatic reset.
CGM Zone Temp Sensor Failure Problem: The GM Zone Temperature sensor input is out of range.	Check: Sensor resistance between 830 ohms (200 F) and 345.7Kohms (-40 F). If so, check field/unit wiring between Sensor and CGM.	The Leaving Solution Reset type selected is Zone Temp Reset, and the unit is reading a signal that is out of range for this input (Temp < -40 F or Temp > 200 F).	(PAR) An automatic reset occurs after the designated Zone Temperature signal returns to its allowable range. In order to prevent rapid cycling of the Diagnostic, there is a 10 second delay before the automatic reset.

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
Circuit 1 Pumpdown Terminated by Time	Unit remained in pumpdown for 30 seconds without the occurrence of an LPC event. Pumpdown sequence was terminated by a 30 second timer.	No Change in unit operation occurs. This diagnostic is for information only.	(INFO) This diagnostic is reset when a compressor on Circuit 1 is staged on due to a cooling demand.
Problem: Unit went through Pumpdown on Circuit 1 and LPC never tripped. Pumpdown was terminated after 30 seconds.			
Check: Check circuit 1 pumpdown solenoid valve and low pressure switch to verify proper operation.			
Circuit 2 Pumpdown Terminated by Time (Circuit #2 40-60 Ton units only)	Unit remained in pumpdown for 30 seconds without the occurrence of an LPC event. Pumpdown sequence was terminated by a 30 second timer.	No Change in unit operation occurs. This diagnostic is for information only.	(INFO) This diagnostic is reset when a compressor on Circuit 2 is staged on due to a cooling demand.
Problem: Unit went through Pumpdown on Circuit 2 and LPC never tripped. Pumpdown was terminated after 30 seconds.			
Check: Check circuit 2 pumpdown solenoid valve and low pressure switch to verify proper operation.			
Compressor Contactor Fail - Circuit 1	The circuit #1 compressor proving input on the SCM/MCM is detected closed continuously for more than 3 seconds while neither compressor output on Circuit #1 is closed.	A "Lockout Circuit #1" request is issued to the Compressor Staging Control function. The Compressor Relays, LPC Bypass Relay, Liquid Line Solenoid Relay, and Hot Gas Bypass Relay for Circuit 1 are all de-energized	(PMR) A manual reset is required after the diagnostic is set. It can be reset by the HI or Tracer, or by cycling power to the CGM.
Problem: The Compressor Contactor for Circuit #1 has malfunctioned.			
Compressor Contactor Fail - Circuit 2 (Circuit #2 40-60 Ton units only)	The Circuit #2 compressor proving input on the MCM is detected closed continuously for more than 3 seconds while neither compressor output on Circuit #2 is closed.	A "Lockout Circuit #2" request is issued to the Compressor Staging Control function. The Compressor Relays, LPC Bypass Relay, and Liquid Line Solenoid Relay for Circuit 2 are all de-energized	(PMR) A manual reset is required after the diagnostic is set. It can be reset by the HI or Tracer, or by cycling power to the CGM.
Problem: The Compressor Contactor for Circuit #2 has malfunctioned.			

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
Compressor Protection - LPC Open - Circuit 1	While the Circuit 1 LPC Bypass Relay was energized, the 7 PSIG LPC switch: a) was open at the time a compressor was requested to start, or b) the switch opened 4 times after a compressor on Circuit 1 was started but prior to accumulating 3 continuous minutes of run time.	A “Lockout Circuit #1” request is issued to the Compressor Staging Control function. The Compressor Relays, LPC Bypass Relay, Liquid Line Solenoid Relay, and Hot Gas Bypass Relay for Circuit 1 are all de-energized.	(PMR) A manual reset is required anytime after the Diagnostic is set. The Diagnostic can be reset by the Human Interface or Tracer, or by cycling power to the CGM.
Compressor Protection - LPC Open - Circuit 2 (Circuit #2 40-60 Ton units only)	While the Circuit 2 LPC Bypass Relay was energized, the 7 PSIG LPC switch: a) was open at the time a compressor was requested to start, or b) the switch opened 4 times after a compressor on Circuit 2 was started but prior to accumulating 3 continuous minutes of run time.	A “Lockout Circuit #2” request is issued to the Compressor Staging Control function. The Compressor Relays, LPC Bypass Relay, and Liquid Line Solenoid Relay for Circuit 2 are all de-energized.	(PMR) A manual reset is required anytime after the Diagnostic is set. The Diagnostic can be reset by the Human Interface or Tracer, or by cycling power to the CGM.
Compressor Trip - Circuit 1	The Circuit #1 Compressor proving input is detected open continuously for more than 3 seconds when either or both compressor outputs on Circuit #1 are energized (as described in the Compressor Protection function).	A “Lockout Circuit #1” request is issued to the Compressor Staging Control function. The Compressor Relays, LPC Bypass Relay, Liquid Line Solenoid Relay, and Hot Gas Bypass Relay for Circuit 1 are all de-energized.	(PMR) A manual reset is required after this diagnostic occurs. The Diagnostic can be reset by the unit mounted Human Interface Module or Tracer, or by cycling power to the CGM.
Compressor Trip - Circuit 2 (Ckt #2 40-60 Ton units only)	The Circuit #2 Compressor proving input is detected open continuously for more than 3 seconds when either or both compressor outputs on Circuit #2 are energized (as described in the Compressor Protection function).	A “Lockout Circuit #2” request is issued to the Compressor Staging Control function. The Compressor Relays, LPC Bypass Relay, Liquid Line Solenoid Relay for Circuit 2 are all de-energized	(PMR) A manual reset is required after this diagnostic occurs. The Diagnostic can be reset by the unit mounted Human Interface Module or Tracer, or by cycling power to the CGM.
Cond Temp Sensor Failure - Circuit 1	The unit is reading a signal that is out of range for the circuit #1 Saturated Condenser Temperature sensor. (Temp < -40 F or Temp > 200 F). Circuit #1.	A “Lockout Circuit # 1” request is issued to the Compressor Staging Control function. The Compressor Relays, LPC Bypass Relay, Liquid Line Solenoid Relay, and Hot Gas Bypass Relay for Circuit 1 are all de-energized.	(PAR) An automatic reset occurs after the #1 Condenser Temperature input returns to its allowable range within 10 seconds.
Problem: The Saturated Condenser Temperature Input is out of range for Circuit #1.			
Check: Sensor resistance between 830 ohms (200 F) and 345.7Kohms (-40 F). If so, check field/unit wiring between Sensor and MCM/SCM.			

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCMS REACTION	RESET REQUIRED
Cond Temp Sensor Failure - Circuit 2 (Circuit #2 40-60 Ton units only)	The unit is reading a signal that is out of range for the circuit #2 Saturated Condenser Temperature sensor. (Temp < -40 F or Temp > 200 F). Problem: The Saturated Condenser Temperature Input is out of range for Circuit #2.	A "Lockout Circuit #2" request is issued to the Compressor Staging Control function. The Compressor Relays, LPC Bypass Relay, and Liquid Line Solenoid Relay for Circuit 2 are all de-energized.	(PAR) An automatic reset occurs after the #2 Condenser Temp input returns to its allowable range within 10 seconds.
Check: Sensor resistance between 830 ohms (200 F) and 345.7Kohms (-40 F). If so,			(PAR) An automatic reset occurs after communication has been restored.
Current Sensing Module Comm Fail	The CGM has lost communications with the CSM. Problem: The CGM has lost communications with the Current Sensing Module (CSM)..	No Change in unit operation occurs. The Current Sensing Module is used for monitoring purposes only, and does not affect unit operation. This diagnostic is for information only.	
Check: Check field/unit wiring between CGM and CSM.		"OFF or "Close" requests are issued as appropriate to the following functions: a. Compressor Staging control. (All Compressor Relays, LPC Bypass Solenoid Relays, LPC Bypass Relay, and HGBP Relay are deenergized) b. Evaporator Solution Pump Control. (S)	(PMR) A manual reset is required after the Emergency Stop input recloses. The Diagnostic can be reset by the Human Interface or Tracer or by cycling power to the CGM.
Emergency Stop	An open circuit has occurred on the Emergency Stop input caused either by a High Duct Temp T-stat trip, or the opening of field-provided contacts, switch, etc...		
Problem: The Emergency Stop input on the CGM is open.			
EST/LST Low Temperature Indication	An abnormal temperature reading of the chilled solution exists.	No change in the unit operation. This diagnostic is for information only.	(INFO) An automatic reset occurs after the EST and LST have both risen to greater than 30F above the heat tape temperature setpoint.
Problem: Either the entering solution temperature or the leaving solution temperature has fallen below the heat tape temperature setpoint.			

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
Evaporator Entering Solution Temperature Sensor Fail Problem: The Evaporator Entering Solution Temperature Sensor input is out of range. Check: Sensor resistance between 830 ohms (200 F) and 345.7Kohms (-40 F). If so, check field/unit wiring between Sensor and CGM.	The unit is reading a signal that is out of range for this input on the CGM. (Temp < -40 F or Temp > 200 F). All Compressor Relays, LPC Bypass relays, and Liquid Line Solenoids will be de-energized. Min On times, HGBP, and Pumpdown will be bypassed. b. If Leaving Solution Reset type selected is Entering Solution Reset, then the Reset type reverts to NONE for the duration of the failure. c. Evaporator Solution Pump Control is not affected. d. The Heat Tape relay output will energize.	When this diagnostic is active: a. A "Lockout Ckts" request is sent to the compressor staging function. When this diagnostic is active: a. A "Lockout Ckts" request is sent to the compressor staging function. All Compressor Relays, LPC Bypass relays, and Liquid Line Solenoids will be de-energized. Min On times, HGBP, and Pumpdown will be bypassed. b. The following functions will be disabled: 1) Compressor Staging, 2) Process/Comfort Cooling, 3) Ice Building. c. Evaporator Solution Pump Control is not affected. d. The Heat Tape relay output will energize.	(PMR) A manual reset is required after this diagnostic occurs. The Diagnostic can be reset by the unit mounted Human Interface Module or Tracer, or by cycling power to the CGM.
Evaporator Leaving Solution Temperature Sensor Fail Problem: The Evaporator Leaving Solution Temperature sensor input is out of range. Check: Sensor resistance between 830 ohms (200 F) and 345.7Kohms (-40 F). If so, check field/unit wiring between Sensor and CGM.	The unit is reading a signal that is out of range for this input on the CGM (Temp < -40 F or Temp > 200 F). All Compressor Relays, LPC Bypass relays, and Liquid Line Solenoids will be de-energized. Min On times, HGBP, and Pumpdown will be bypassed. b. The following functions will be disabled: 1) Compressor Staging, 2) Process/Comfort Cooling, 3) Ice Building. c. Evaporator Solution Pump Control is not affected. d. The Heat Tape relay output will energize.	When this diagnostic is active: a. A "Lockout Ckts" request is sent to the compressor staging function. All Compressor Relays, LPC Bypass relays, and Liquid Line Solenoids will be de-energized. Min On times, HGBP, and Pumpdown will be bypassed. b. The following functions will be disabled: 1) Compressor Staging, 2) Process/Comfort Cooling, 3) Ice Building. c. Evaporator Solution Pump Control is not affected. d. The Heat Tape relay output will energize.	(PMR) A manual reset is required after this diagnostic occurs. The Diagnostic can be reset by the unit mounted Human Interface Module or Tracer, or by cycling power to the CGM.

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
Evaporator Solution Flow Loss The switch connected to the flow proving switch input on a unit with a Brazed Plate heat exchanger has failed CLOSED; or during power-up, a unit with a Brazed Plate heat exchanger has detected that older versions of control modules are installed.	Units with a Brazed Plate heat exchanger require a flow proving switch for freeze protection functionality. This flow proving switch input was detected closed (shorted) at the time the solution pump was commanded ON (Only on units with "Chiller Solution Pump Mode" set to AUTO). Also, units with Brazed Plate heat exchanger require newer versions of control boards for proper operation. During power-up, the unit detected at least one replacement module with a Software Version number less than what is required.	A "Lockout all Circuit" request is issued to the compressor staging function. Compressor Relays, LPC Bypass Relays, Liquid Line Solenoid Relays and HGBP relay are all de-energized. For Service Parts Replacement, please note: (a) For proper operation of units with Brazed Plate heat exchangers, please insure the following board is installed: Multiple Compressor Module (MCM) - Software Version number greater than or equal to 10.00 or Single Compressor Module (SCM) - Software Version number greater than or equal to 10.00	(PMR) A manual reset is required after this diagnostic occurs. The Diagnostic can be reset by the unit mounted Human Interface Module or Tracer, or by cycling power to the CGM. please note: (a) For proper operation of units with Brazed Plate heat exchangers, please insure the following board is installed: Multiple Compressor Module (MCM) - Software Version number greater than or equal to 10.00 or Single Compressor Module (SCM) - Software Version number greater than or equal to 10.00 (b) To eliminate this diagnostic when it is due to an incompatible Software Version number(s), please install the appropriate board(s) per the following: Cold Generator Module (CGM) - Software Version number greater than or equal to 3.00 CG Unit Human Interface (HI) - Software Version number greater than or equal to 27.00

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
Evap Solution Flow Proving Switch Problem: Solution Flow Switch is open after the Solution Pump is ON. Check: Verify Solution Pump operation and that the Evaporator Solution Flow Switch is working properly.	The diagnostic can occur at any time after the Evaporator Solution Pump Relay has been requested ON, and the Solution Flow Switch input is detected OPEN (no flow) for 5 continuous minutes.	When the Solution Flow Switch input is detected OPEN (no flow) for 6 continuous seconds, the Unit will de-energize the following relays: Compressor Relays, LPC Bypass Relays, Liquid Line Solenoids, and HGBP Relay.	(PAR) An automatic reset occurs after the Evap Solution Flow Proving Switch has detected Solution flow for 6 continuous seconds.
External Leaving Solution STP Input Fail Problem: CGM is receiving an External Leaving Solution Setpoint (LSS) Input signal which is out of range. Check field/unit wiring between CGM and External Leaving Solution Setpoint potentiometer.	The External Leaving Solution Setpoint (LSS) is designated as the Leaving Solution Setpoint source and it is out of range. Out of range is defined as one of the following: a) External LSS > 65 deg F or < 51 deg F for unit with LSS Range 51-65 deg F. b) External LSS > 50 deg F or < 40 deg F for unit with LSS Range 40-50 deg F. c) External LSS > 39 deg F or < 30 deg F for unit with LSS Range 30-39 deg F. d) External LSS > 29 deg F or < 20 deg F for unit with LSS Range 20-29 deg F. e) External LSS > 75 deg F or < 10 deg F for unit with LSS Range SPECIAL.	While the diagnostic is active, the Leaving Solution Setpoint will revert to using the default (HI) Leaving Solution Setpoint.	(PAR) An automatic reset occurs after the External Leaving Solution Setpoint returns to its allowable range. In order to prevent rapid cycling of the Diagnostic, there is a 10 second delay before the automatic reset.

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
GBAS 0-5VDC Module Comm Failure Problem: The CGM has lost communications with the GBAS Module. Check: Check field/unit wiring between CGM and GBAS.	The CGM has lost communications with the GBAS Module.	<p>The UCM will initiate the following actions;</p> <ul style="list-style-type: none"> a. If the Demand Limit input was closed prior to communications loss, then the Demand Limit commands issued to the Compressor Staging function will be cancelled. b. If any of the GBAS setpoint control parameters are the HI-selected setpoint sources, then those setpoints will revert to the default HI setpoints. c. Any active GBAS output control parameters will be ignored. d. A failsafe function in the GBAS module will cause all GBAS outputs to be zeroed and de-energized. 	(PAR) An automatic reset occurs after communication has been restored.
GBAS 0-5VDC Module Comm Failure Problem: The CGM has lost communications with the GBAS Module. Check: Check field/unit wiring between CGM and GBAS.	The CGM has lost communications with the GBAS Module.	<p>The UCM will initiate the following actions;</p> <ul style="list-style-type: none"> a. If the Demand Limit input was closed prior to communications loss, then the Demand Limit commands issued to the Compressor Staging function will be cancelled. b. If any of the GBAS setpoint control parameters are the HI-selected setpoint sources, then those setpoints will revert to the default HI setpoints. c. Any active GBAS output control parameters will be ignored. d. A failsafe function in the GBAS module will cause all GBAS outputs to be zeroed and de-energized. 	(PAR) An automatic reset occurs after communication has been restored.

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
Hot Start Load Limit (Auto) Problem: The Leaving Solution Temperature is too hot.	Hot Operation Response is set to "50% CAPACITY PER CKT, AUTO RESET DIAG". The Leaving Solution Temp exceeded the Hot Start Load Limit Setpoint after the Hot Start Time Interval expired.	While this diagnostic is active, the second compressor on each refrigerant circuit is shut off and/or prevented from staging ON.	(PAR) An automatic reset occurs after the Leaving Solution Temperature decreases 5 deg F or more below the Hot Start Load Limit Setpoint.
Hot Start Load Limit (Info) Problem: The Leaving Solution Temperature is too hot.	Hot Operation Response is set to "ALLOW NORMAL OPERATION, INFO RESET DIAG". The Leaving Solution Temp exceeded the Hot Start Load Limit Setpoint after the Hot Start Time Interval expired.	No change in unit operation occurs. This diagnostic is for information only.	(INFO) An automatic reset occurs after the Leaving Solution Temperature decreases 5 deg F or more below the Hot Start Load Limit Setpoint.
Hot Start Load Limit (Man) Problem: The Leaving Solution Temperature is too hot.	Hot Operation Response is set to "SHUT OFF COMPRESSORS, MANUAL RESET DIAG". The Leaving Solution Temp exceeded the Hot Start Load Limit Setpoint after the Hot Start Time Interval expired.	A "lockout all Ckts" request is issued to the compressor staging function. The Unit will deenergize the following relays: Compressor Relays, LPC Bypass Relays, Liquid Line Solenoids, and HGBP Relay. Comfort/Process Cooling, and Ice Building are terminated and prevented from occurring until the diagnostic condition is cleared.	(P/MR) A manual reset is required after this diagnostic occurs. The Diagnostic can be reset by the unit mounted Human Interface Module or Tracer, or by cycling power to the CGM.
Hot Start Load Limit Setpoint Fail Problem: The Hot Start Load Limit Setpoint is out of range. Check: If Hot Start Load Limit Setpoint Source is assigned to either GBAS module, but this setpoint has not been assigned to one of that GBAS module's analog inputs, this diagnostic can occur.	The unit is reading a signal that is out of range for the Hot Start Load Limit Setpoint.	The default (H1) Hot Start Load Limit Setpoint will become the active setpoint while this diagnostic is active.	(PAR) An automatic reset occurs after the designated Hot Start Load Limit Setpoint source sends a signal that is within range for 10 continuous seconds, or after a different setpoint source is user-defined.

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
IBTS Adjusted to Maintain Min Diff Problem: The active Ice Build Terminate Setpoint and the Leaving Solution Cutout Temp Setpoint are too close together for proper unit operation.	The active Ice Build Terminate Setpoint is set to the Leaving Solution Cutout Temp Setpoint plus the larger of 1) calculated Minimum Differential value, or 2) 6.5 deg F.	The active Ice Build Terminate Setpoint will become the active setpoint while this diagnostic is active.	(PAR) An automatic reset occurs after the difference between the active Ice Build Terminate Setpoint and the Leaving Solution Cutout Temp Setpoint meets the minimum difference requirement.
Ice Build Terminate Setpoint Fail Problem: The Ice Build Terminate Setpoint is out of range. Check: If Ice Build Terminate Setpoint Source is assigned to either GBAS module, but this setpoint has not been assigned to one of that GBAS module's analog inputs, this diagnostic can occur.	The unit is reading a signal that is out of range for the Ice Build Terminate Setpoint.	The default (HI) Ice Build Terminate Setpoint will become the active setpoint while this diagnostic is active.	(PAR) An automatic reset occurs after the designated Ice Build Terminate Setpoint source sends a signal that is within range for 10 continuous seconds, or after a different setpoint source is user-defined.
Leaving Solution Setpoint Fail Problem: The designated Leaving Solution Setpoint is out of range. If either GBAS module is designated as the Leaving Solution Setpoint source, verify that GBAS module has this input assigned to one of its analog inputs.	The designated Leaving Solution Setpoint source is out of range. Out of range is defined as one of the following: a) LSS > 65 deg F or < 51 deg F for unit with LSS Range 51-65 deg F. b) LSS > 50 deg F or < 40 deg F for unit with LSS Range 40-50 deg F. c) LSS > 39 deg F or < 30 deg F for unit with LSS Range 30-39 deg F. d) LSS > 29 deg F or < 20 deg F for unit with LSS Range 20-29 deg F. e) LSS > 75 deg F or < 10 deg F for unit with LSS Range SPECIAL.	While the diagnostic is active, the Leaving Solution Setpoint will revert to using the default (HI) Leaving Solution Setpoint.	(PAR) An automatic reset occurs after the designated Leaving Solution Setpoint returns to its allowable range. In order to prevent rapid cycling of the Diagnostic, there is a 10 second delay before the automatic reset.
Liquid Pressure Sensor Fail Circuit 1 Problem: Circuit 1 Saturated Liquid Line Pressure sensor input is out of range. Check: Check field/unit wiring between Sensor and SSM.	The unit is reading a signal that is out of range for the Circuit 1 Saturated Liquid Line Pressure Sensor input on the SSM. (Pressure < 0 PSIG or Pressure > 400 PSIG).	The Superheat/Subcool calculation is invalid and the values are set to zero. No other change in unit operation occurs. This diagnostic is for information only.	(INFO) An automatic reset occurs after the Circuit 1 Saturated Liquid Pressure Sensor input returns to its allowable range. In order to prevent rapid cycling of the Diagnostic, there is a 10 second delay before the automatic reset.

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
Liquid Pressure Sensor Fail Circuit 2 (Circuit #2 40-60 Ton units only)	The unit is reading a signal that is out of range for the Circuit 2 Saturated Liquid Line Pressure Sensor input on the SSM. (Pressure < 0 PSIG or Pressure > 400 PSIG).	The Superheat/Subcool calculation is invalid and the values are set to zero. No other change in unit operation occurs. This diagnostic is for information only.	(INFO) An automatic reset occurs after the Circuit 2 Saturated Liquid Pressure Sensor input returns to its allowable range. In order to prevent rapid cycling of the Diagnostic, there is a 10 second delay before the automatic reset.
Problem: Circuit 2 Saturated Liquid Line Pressure sensor input is out of range.	Check: Check field/unit wiring between Sensor and SSM.		
Low Ambient Evaporator Solution Pump Override	The Outside Air (Ambient) temperature is below the Low Ambient Evap Pump Override Temp Setpoint.	The Evaporator Solution Pump Relay is energized while this condition exists.	(PAR) An automatic reset occurs after the Outside Air Temp increases 5 deg F or more above the Low Ambient Evaporator Pump Override Temp Setpoint.
Problem: Outside Air Temp too low, request Solution Pump to run to keep Solution moving.			
Low Solution Cutout Temperature (Auto)	While no compressors were running, the Evaporator Solution Temperature(s) went below the Low Solution Cutout Temp Setpoint.	While this diagnostic is active, Compressors are prevented from staging on. The Unit will deenergize the following: Compressor Relays, LPC Bypass Relays, Liquid Line Solenoids, and HGBP Relay.	(PAR) An automatic reset occurs after the Evaporator Solution Temperature(s) rises 4 deg F or more above the Low Solution Cutout Temperature Setpoint.
Problem: The Evaporator Leaving or Entering Solution Temperature is too low.			
Low Solution Cutout Temperature (Man)	While compressors were running, the Evaporator Solution Temperature(s) went below the Low Solution Cutout Temperature Setpoint.	A "Lockout all Circuits" request is issued to the Compressor Staging Function. Compressors are prevented from staging on and the Unit will de-energize the following relays: Compressor Relays, LPC Bypass Relays, Liquid Line Solenoids, and HGBP Relay.	(PMR) A manual reset is required after this diagnostic occurs. The Diagnostic can be reset by the unit mounted Human Interface Module or Tracer, or by cycling power to the CGM.
Problem: The Evaporator Leaving or Entering Solution Temperature is too low.			
Low Pressure Control Open - Circuit 1	With one or more compressors running, the higher pressure of the two LPC switches on Circuit 1 has opened 6 times with the LPC Bypass relay de-energized, or it was open at the time the LPC Bypass Relay de-energized. On a standard unit this is the 45 PSIG LPC switch, but can be 20 PSIG or lower on units with a lower Leaving Solution Setpoint range.	A "Lockout Circuit # 1" request is issued to the Compressor Staging Control function. The Compressor Relays, LPC Bypass Relay, Liquid Line Solenoid Relay, and Hot Gas Bypass Relay for Circuit 1 are all de-energized.	(PMR) A manual reset is required anytime after the Diagnostic is set. The Diagnostic can be reset by the Human Interface or Tracer, or by cycling power to the CGM.
Problem: The refrigerant in Circuit 1 is cold and may cause the Solution in the Chiller barrel to become too cold. Also, there may be a state of charge issue with Circuit 1.			

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
Low Pressure Control Open - Circuit 2 (Circuit #2 40-60 Ton units only)	With one or more compressors running, the higher pressure of the two LPC switches on Circuit 2 has opened 6 times with the LPC Bypass relay de-energized, or it was open at the time the LPC Bypass Relay de-energized. On a standard unit this is the 45 PSIG LPC switch, but can be 20 PSIG or lower on units with a lower Leaving Solution Setpoint range.	A "Lockout Circuit # 2" request is issued to the Compressor Staging Control function. The Compressor Relays, LPC Bypass Relay, Liquid Line Solenoid Relay, and Hot Gas Bypass Relay for Circuit 2 are all de-energized.	(PMR) A manual reset is required anytime after the Diagnostic is set. The Diagnostic can be reset by the Human Interface or Tracer, or by cycling power to the CGM.
LSS Adjusted to Maintain Minimum Differential	The active Leaving Solution Setpoint and the Leaving Solution Cutout Temperature Setpoint are too close together for proper unit operation. Problem: The active Leaving Solution Setpoint (LSS) is closer to the Leaving Solution Cutout Temp Setpoint than the calculated Minimum Differential.	The active Leaving Solution Setpoint is set to the Leaving Solution Cutout Temperature Setpoint plus the calculated Minimum Differential value.	(PAR) An automatic reset occurs after the difference between the active Leaving Solution Setpoint and the Leaving Solution Cutout Temperature Setpoint meets the minimum difference requirement.
MCM Communications Failure (40-60 Ton units only)	The CGM has lost communications with the MCM.	A "Lockout" request is sent to the Compressor Staging Control function. The Liquid Line Solenoid Relays and LPC Byp-energized.	(PAR) An automatic reset occurs after communication has been restored.
Sat Liquid Temperature Sensor Fail Circuit 1	Check: Check field/unit wiring between CGM and MCM.	The Superheat/Subcool Module is installed and the unit is reading a signal that is out of range for the Circuit 1 Saturated Liquid Line Temperature Sensor input on the SCM/MCM. (Temp < -55 F or Temp > 209 F).	(INFO) An automatic reset occurs after the Circuit 1 Saturated Liquid Temperature Sensor input returns to its allowable range. In order to prevent rapid cycling of the Diagnostic, there is a 10 second delay before the automatic reset.

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
Saturated Liquid Temperature Sensor Fail - Circuit 2 (Circuit #2 40-60 Ton units only)	The Superheat/Subcool Module is installed and the unit is reading a signal that is out of range for the Circuit 2 Saturated Liquid Line Temperature Sensor input on the MCM. (Temp < -40 F or Temp > 200 F).	The Superheat/Subcool calculation is invalid and the values are set to zero. No other change in unit operation occurs. This diagnostic is for information only.	(INFO) An automatic reset occurs after the Circuit 2 Saturated Liquid Temperature Sensor input returns to its allowable range. In order to prevent rapid cycling of the Diagnostic, there is a 10 second delay before the automatic reset.
Check: Sensor resistance between 830 ohms (200 F) and 345.7Kohms (-40 F). If not, check field/unit wiring between Sensor and MCM.			
SCM Communications Failure (20-30 Ton units only)	The CGM has lost communications with the SCM.	A "Lockout" request is sent to the Compressor Staging Control function. The Liquid Line Solenoid Relays and LPC Bypass Relays are de-energized. A failsafe function in the SCM will cause all SCM outputs to be zeroed and de-energized.	(PAR) An automatic reset occurs after communication has been restored.
Problem: The CGM has lost communications with the SCM.			
Check: Check field/unit wiring between CGM and SCM.			
Suction Temp Sensor Fail - Circuit 1	The Superheat/Subcool Module is installed and the unit is reading a signal that is out of range for the Circuit 1 Suction Line Temp Sensor input on the SCM/MCM. (Temp < -40 F or Temp > 200 F).	The Superheat/Subcool calculation is invalid and the values are set to zero. No other change in unit operation occurs. This diagnostic is for information only.	(INFO) An automatic reset occurs after the Circuit 1 Suction Line Temp Sensor input returns to its allowable range. In order to prevent rapid cycling of the Diagnostic, there is a 10 second delay before the automatic reset.
Problem: Circuit 1 Suction Line Temp sensor input is out of range.			
Check: Sensor resistance between 830 ohms (200 F) and 345.7Kohms (-40 F). If not, check field/unit wiring between Sensor and SCM/MCM.			
Suction Temp Sensor Fail - Circuit 2 (Ckt #2 40-60 Ton units only)	The Superheat/Subcool Module is installed and the unit is reading a signal that is out of range for the Circuit 2 Suction Line Temperature Sensor input on the MCM. (Temp < -40 F or Temp > 200 F).	The Superheat/Subcool calculation is invalid and the values are set to zero. No other change in unit operation occurs. This diagnostic is for information only.	(INFO) An automatic reset occurs after the Circuit 2 Suction Line Temperature Sensor input returns to its allowable range. In order to prevent rapid cycling of the Diagnostic, there is a 10 second delay before the automatic reset.
Problem: Circuit 2 Suction Line Temp sensor input is out of range.			
Check: Sensor resistance between 830 ohms (200 F) and 345.7Kohms (-40 F). If not, check field/unit wiring between Sensor and MCM.			

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
Suction Temperature Sensor Fail - Circuit 1 Problem: Circuit 1 Suction Line Temperature sensor input is out of range. Check: Sensor resistance between 830 ohms (200 F) and 345.7Kohms (-40 F). If not, check field/unit wiring between Sensor and SCM/MCM.	The Superheat/Subcool Module is installed and the unit is reading a signal that is out of range for the Circuit 1 Suction Line Temperature Sensor input on the SCM/MCM. (Temp < -40 F or Temp > 200 F).	The Superheat/Subcool calculation is invalid and the values are set to zero. No other change in unit operation occurs. This diagnostic is for information only.	(INFO) An automatic reset occurs after the Circuit 1 Suction Line Temperature Sensor input returns to its allowable range. In order to prevent rapid cycling of the Diagnostic, there is a 10 second delay before the automatic reset.
Suction Temperature Sensor Fail - Circuit 2 (Ckt #2 40-60 Ton units only) Problem: Circuit 2 Suction Line Temperature sensor input is out of range. Check: Sensor resistance between 830 ohms (200 F) and 345.7Kohms (-40 F). If not, check field/unit wiring between Sensor and MCM.	The Superheat/Subcool Module is installed and the unit is reading a signal that is out of range for the Circuit 2 Suction Line Temperature Sensor input on the MCM. (Temp < -40 F or Temp > 200 F).	The Superheat/Subcool calculation is invalid and the values are set to zero. No other change in unit operation occurs. This diagnostic is for information only.	(INFO) An automatic reset occurs after the Circuit 2 Suction Line Temperature Sensor input returns to its allowable range. In order to prevent rapid cycling of the Diagnostic, there is a 10 second delay before the automatic reset.
Superheat/Subcool Module Comm Fail Problem: The CGM has lost communications with the SSM. Check: Check field/unit wiring between CGM and SSM Module.	The CGM has lost communications with the SSM.	No Change in unit operation occurs. The Superheat/Subcool Module is used for monitoring purposes only, and does not affect unit operation. This diagnostic is for information only.	(PAR) An automatic reset occurs after communication has been restored.

System Testing & Troubleshooting

DIAGNOSTIC DISPLAYED	REASON FOR DIAGNOSTIC	UCM'S REACTION	RESET REQUIRED
BAS Module Communications Failure Problem: The RTM has lost communications with the TCI or LCI. Check: Check field/ unit wiring between RTM and TCI or LCI Module.	CGM has lost communications with the TCI or LCI Module.	All active commands and setpoints provided by the network through the TCI or LCI will be cancelled and/ or ignored. Where the network has been designated as setpoint source, local HI default setpoints will be used.	(PAR) An automatic reset occurs after communication has been restored.
BAS/NETWORK Comm Failure Problem: The TCI or LCI has lost communications with Tracer. Check: Network (Tracer or 3rd party building control panel) is powered up and running properly. If so, check unit wiring between TCI or LCI and network (Tracer or 3rd party building control panel)	The TCI or LCI has lost communications with the network for > 15 minutes.	All active commands and setpoints provided by the network through the TCI or LCI will be cancelled and/ or ignored. Where the network has been designated as setpoint source, local HI default setpoints will be used.	(PAR) An automatic reset occurs after communications with the network and TCI or LCI has been restored.
Unit HI Communications Failure Problem: The CGM has lost communications with the Unit mounted (local) Human Interface (HI). Check: Field/unit wiring between CGM and Local HI.	The CGM has lost communications with the unit-mounted Human Interface.	A failsafe function in the HI will; a. disallow any interaction between the HI and the CGM (or any other modules), b. render all HI keystrokes ineffective, and c. cause the following to be displayed on the unit-mounted HI display: LOCAL HI COMMUNICATIONS LOSS CHECK COMM LINK WIRING BETWEEN MODULES	(INFO) An automatic reset occurs after communication has been restored between the CGM and the HI. When the failure screen is cleared, the General display is restored and HI interaction with the CGM is again permitted. (If the unit has a remote HI option, then on the remote HI module, this diagnostic will be reported and displayed as any other automatic reset diagnostic).
